

Bring the problem first.

This guide provides a simple starting point for students, advisors, researchers, agencies, consultants, and organizations. The purpose is to understand the question first and then discuss whether BAITSSS may be useful and what form of support, access, or collaboration could be appropriate.

Starting point

A short description of the scientific, field, or water-management problem is usually enough to begin. From there, we can consider the available evidence, the intended use, and whether BAITSSS is a reasonable fit.

WHAT TO SEND FIRST

Four items help make the first discussion useful.

1. Place	Field, farm, district, basin, research site, or study area.
2. Period	Event, growing season, year, multi-year period, or another time window.
3. Question	What you are trying to understand, compare, estimate, investigate, or support.
4. Evidence	Available irrigation, weather, soil, field observations, remote sensing, or other project data.

HOW AN INQUIRY MAY PROCEED

The pathway can be matched to the project.

1	Initial inquiry Describe the problem, study context, and intended use.
2	Fit discussion We consider whether BAITSSS appears scientifically and technically relevant to the question.
3	Advisor or project-lead involvement For student work involving substantial support, software access, validation, benchmarking, or source-code questions, including the advisor or project lead is helpful.
4	Possible pathway Depending on the need, the next step may be a short discussion, project analysis, research collaboration, demonstration, training, Desktop access, or organizational work.
5	Project scope When substantial work is involved, responsibilities, deliverables, schedule, data needs, support, and cost can be discussed before work begins.

Student projects and access questions

Student projects are welcome. When a request involves substantial technical support, software access, validation, benchmarking, or source-code questions, including the advisor or project lead helps clarify the research objective, responsibilities, and an appropriate arrangement.

VALIDATION, BENCHMARKING & COMPARATIVE WORK

These requests can be considered within a defined project context.

Independent evaluation is welcome.

Researchers interested in evaluating, benchmarking, or comparing methods are welcome to contact us. Because this work may involve software access, model execution, technical support, or interpretation, the appropriate scope and access arrangement are considered together with the project team. Source-code access, where relevant, is considered separately in the context of the project and institutional arrangement.

WHAT BAITSSS MAY SUPPORT

The form of support can be matched to the scientific or professional need.

Project analysis	Project-specific ET, soil-water, irrigation, spatial, temporal, and model-output analysis.
Technical outputs	Maps, time series, exports, documented runs, figures, tables, and project records as appropriate to the agreed scope.
Research support	Study-design input, reproducible workflow, methods documentation, interpretation, evaluation, and collaboration where appropriate.
Training / Desktop use	Guidance or software access when direct use of BAITSSS is an appropriate part of the project.
Organization-level work	Licensing, integration, sponsored development, or technical partnership where a broader arrangement is useful.

A FEW POINTS TO CLARIFY

Publication outcomes depend on the overall study, novelty, interpretation, review, and journal decisions. Software access, technical support, validation work, and source-code questions are considered in relation to the project rather than assumed from the outset. If another freely available tool already answers the question well, that may also be worth considering.

STANDARD FIRST RESPONSE

Thank you for your interest in BAITSSS.

Please send a short description of the problem you are trying to solve, the study area, the period of interest, and the data or observations you already have. We will first consider whether BAITSSS appears to be a reasonable fit.

If this is student research, or if the request involves validation, benchmarking, substantial technical support, software access, or source-code questions, please include the advisor or project lead if possible. We can then discuss an appropriate next step.

OPEN DOOR, DEFINED SCOPE

The first conversation is open to everyone. Pricing, access level, collaboration structure, and support are considered only after the problem and likely work are better understood.
