

Bring the problem first.

A standard path for students, advisors, researchers, agencies, consultants, and organizations. You do not need to decide in advance whether you need software, analysis, training, collaboration, or another form of support.

Core principle

Start with the scientific, field, or water-management problem. We first determine whether BAITSSS is a reasonable fit. Only then do we decide the appropriate level of access, analysis, collaboration, or support.

WHAT TO SEND FIRST

A short first message is enough.

1. Place	Field, farm, district, basin, research site, or study area.
2. Period	Event, growing season, year, multi-year period, or another time window.
3. Question	What you need to understand, compare, estimate, investigate, or support.
4. Evidence	Available irrigation, weather, soil, field observations, remote sensing, or other data.

HOW THE REQUEST IS HANDLED

One standard path for every inquiry.

1	Initial inquiry Describe the problem and intended use.
2	Quick fit assessment We determine whether BAITSSS is scientifically and technically appropriate.
3	Advisor involvement when needed For student research involving substantial support, software access, or source-code questions, the advisor or supervisor should join the discussion.
4	Choose the pathway Possible outcomes include short guidance, a demonstration, project analysis, research collaboration, BAITSSS Desktop access, training, or an organizational integration discussion.
5	Define scope For substantial work, responsibilities, deliverables, schedule, data, support, and cost are defined before work begins.

Student or source-code request?

An informal student request does not automatically lead to source-code transfer. The first step is to understand the research question and involve the advisor or supervisor when the request concerns substantial technical support, software access, or code. The project may be better served through analysis, training, Desktop access, or a defined collaboration.

WHAT BAITSSS MAY PROVIDE

The support is matched to the problem.

Project analysis	Project-specific ET, soil-water, irrigation, spatial, temporal, and model-output analysis.
Technical outputs	Maps, time series, exports, documented model runs, figures, tables, and project records as defined in scope.
Research support	Study design input, reproducible analysis workflow, methods documentation, interpretation, and collaboration where appropriate.
Training / Desktop use	Guidance or access for qualified users when running BAITSSS directly is the better solution.
Organization-level work	Licensing, integration, sponsored development, or technical partnership when the need extends beyond a single analysis.

WHAT IS NOT AUTOMATIC

Clear boundaries keep the door open without creating unlimited obligations.

- **No guaranteed publication.** BAITSSS can support technical work, but publication depends on the overall study, novelty, interpretation, review, and journal decision.
- **No automatic source-code transfer.** Code access is a separate decision and may require advisor, institutional, licensing, or collaboration arrangements.
- **No unlimited student support.** Substantial work is scoped so responsibilities are clear for the student, advisor, and BAITSSS team.
- **No assumption that BAITSSS is always the right tool.** If a simpler or freely available product already answers the question, we should say so early.

STANDARD FIRST RESPONSE

A short reply that can be reused.

Thank you for your interest in BAITSSS.

Please send a short description of the problem you are trying to solve, the study area, the period of interest, and the data or observations you already have. We will first determine whether BAITSSS is a reasonable fit.

If this is student research and the request involves substantial technical support, software access, or source code, please include your advisor or supervisor in the discussion. We can then decide whether the appropriate next step is guidance, project analysis, research collaboration, BAITSSS Desktop access, training, or another arrangement.

OPEN DOOR, DEFINED SCOPE

The first conversation is open to everyone. Pricing, access level, collaboration structure, and support are not predetermined. They are considered only after the problem and required work are understood.
